

GROKROUTER

SOURCE REPO

HOW GROKROUTER WORKS

A plain-English map of the experimental source project

Grok stays. The brain changes.

You keep the Grok Bot interface and choose which model handles the thinking behind each Bot.

WHAT STAYS THE SAME

Grok Bot stays the same. The AI brain changes.

Same chat, files and computer. A small router sends each turn to the model you choose.

GrokRouter · beta.40 · unofficial, reversible beta

A narrow, reversible patch.

The repo verifies the exact target before changing anything, then keeps a checked stock backup for recovery.

CHECK

Confirm Grok Bot 0.30.0

Unknown builds stop here instead of being guessed at.

CONNECT

Open a loopback diagnostic session

The temporary connection stays on 127.0.0.1.

TRANSFER

Send a checksummed payload

The installer uses Grok's visible Bot computer and verifies every archive.

PATCH

Insert one small executor

Provider logic stays in a separate runtime that can be replaced or removed.

RESTORE

Keep the original path

Restore Stock returns the verified original host when you want out.

Fail closed: a bad version, hash, source anchor, checksum or terminal check stops the operation before activation.

The router does not become Grok.

It changes the inference path. Grok keeps the product surface and the authority around tools.

Grok keeps

- Desktop app and chat
- Bots and history
- Files and computer
- Tool execution
- Permission behavior
- Assistant delivery

Router changes

- Provider per Bot
- Model per Bot
- Reasoning level
- Provider thread state
- Schema translation
- Redacted diagnostics

DATA AND TOOL BOUNDARY

- 01** The chosen provider receives the conversation content needed for that routed turn.
- 02** A provider can request only a tool schema Grok actually supplied.
- 03** Grok applies permissions, performs the action and returns the result.
- 04** Provider keys are loaded at request time and excluded from repo state and audit logs.

Public, experimental, evolving.

GrokRouter is a working source experiment that will keep improving as Grok Bot changes and new provider paths are tested.

Start with the repo

Read the source, review the architecture and follow the current setup notes. Direct Bot chat is the cleanest place to test routing while channel behavior continues to evolve.

GITHUB

promptadvisers/grokrouter

<https://github.com/promptadvisers/grokrouter>

FIRST CHECKS IN A DIRECT BOT CHAT

/doctor

If the exact Grok build is unsupported, stop and wait for the repo to add a reviewed compatibility update.
