

Mac Mini Clawdbot Setup

Your 24/7 JARVIS deployment guide

1. Mac Mini Configuration

Setting	Location	Action
Remote Login (SSH)	Settings > Sharing	Enable
Screen Sharing	Settings > Sharing	Enable
Power Settings	Settings > Energy	Disable sleep

Write down your Mac Mini username and password - you'll need both for SSH.

2. Clawdbot Installation

```
clawdbot onboard install
```

- Install Claude on Mac Mini FIRST before creating setup token
- Token auth opens in browser, then Max Plan works
- When SSH prompts for password, enter manually (don't let Warp do it)

3. Keep Mac Mini Alive

```
caffeinate -d -i -s -u &
```

- Prevents sleep during SSH sessions and background tasks
- For bulletproof uptime, install Amphetamine from App Store

4. Telegram Setup (Recommended)

- Open Telegram, search for @BotFather
- Send /newbot and follow prompts
- Copy the bot token into Clawdbot wizard
- Use a separate Telegram account (not your personal)

5. Skills Configuration

```
# In Clawdbot wizard, select skills:
```

Skill	API Key Required	Use Case
11 Labs	Yes	Voice responses
Brave Search	Yes (free tier)	Web search
Whisper	OpenAI key	Voice transcription
Nano Banano	Gemini key	Image generation

6. File Transfer Between Machines

```
# From main laptop, pull files from Mac Mini:
```

```
scp username@mac-mini-ip:~/path/to/file ./local/path
```

- Connect via shared Wi-Fi or ethernet cable (more stable)
- Use Screen Sharing for GUI access to Claudette's desktop

7. Token Usage Warning

Plan	Recommendation
Max Plan (\$200/mo)	Use Sonnet freely
Pro Plan	Use Haiku, be specific with prompts
Free/API Only	Consider local models (Ollama)

Vague prompts = token drain. Be specific with commands.

8. Core Files Reference

File	Purpose
soul.md	Personality, behavior, communication style
identity.md	Name, emoji, role definition
tools.md	MCP server instructions
skills/*.json	Individual skill configurations
