

DYNAMIC WORKFLOWS Prompt Pack

The exact prompts to run a back office from one window

Companion pack for the Dynamic Workflows video
Copy, paste, point it at a folder. A team of agents does the rest.

Mark Kashef | Early AI Dopters
<https://www.skool.com/earlyaidopters/about>

START HERE — HOW TO RUN ONE

A dynamic workflow is Claude Code writing a little program that hires a team of agents, runs them in parallel, and has them check each other before anything reaches you. Three ways to start one:

1. Put the word **workflow** anywhere in your prompt. Claude writes one for that task.
2. Type **/effort ultracode** and Claude decides on its own when a job needs a team.
3. Use the built-in **/deep-research <question>** for cross-checked web research.

Watch any run live with **/workflows**. When a run does exactly what you want, press **s** to save it as your own command for next time.

The five anchors of a good workflow prompt

- Point it at a folder. `cd` into the directory first so the agents have the files.
- Say the word **workflow**, that is the trigger.
- Name what to find and the exact shape of the output you want back.
- Demand the second agent. Ask for an independent agent to challenge or verify every finding, so false positives get dropped.
- Use it only when the job is Repeatable, Wide, and Worth resuming. For a one-off, a single file, or a quick question, just ask Claude normally.

On cost. A big run can use most of a five hour window in about thirty minutes on the \$100 plan. Read it the right way. A run that costs a few dollars does the work a junior would bill thousands for over weeks. Point it at the job that used to cost you a week.

DEMO 1A — Data Room Risk Audit

WHEN TO USE IT

- You have a folder of contracts to review fast
- M&A diligence, vendor reviews, a portfolio of leases
- You want a ranked risk memo, not a pile of summaries

THE PROMPT

This folder is the data room for a company we're acquiring called Northwind Logistics. I'm the diligence lead. Build a workflow that reads every contract in here in parallel and flags anything that hurts the deal: change-of-control clauses that let a counterparty walk or renegotiate when we buy the company, auto-renewal traps that lock us in, missing or unsigned signature blocks, uncapped indemnities, assignment restrictions that block us from transferring the contract, exclusivity commitments, and unusual liability terms. For every single flag, spin up a second agent that tries to refute it: wrong clause, already handled elsewhere in the same document, or just market-standard and not worth raising. Only keep the findings that survive. Hand me back a one-page risk memo ranked by how badly each item threatens the close, with the file name, the exact clause, why it matters in plain English, and how confident you are after the challenge.

GUARDRAILS

- cd into the data room folder first, then launch claude
- Swap Northwind for your target, or drop that sentence entirely
- Keep the refute step so market-standard noise gets dropped

WHAT GOOD LOOKS LIKE

- A one-page memo ranked by threat to the close
- Each finding shows the file, the clause, and a confidence
- A short appendix of flags it dropped, with the reason why

DEMO 1B — Data Room Discovery (needle in a haystack)

WHEN TO USE IT

- You suspect something is buried and you want it found
- Investigations, discovery, deep diligence on a big pile
- You want contradictions between documents surfaced

THE PROMPT

Build a workflow that reads every file in this entire data room and hunts for the things a seller would rather we never find. Look for related-party transactions and vendors paid above market, side letters that quietly waive a key term in another contract, change-of-control triggers, litigation or regulatory trouble that is hinted at in emails but missing from the litigation schedule, personal guarantees by the founder, customer concentration that contradicts what management claims, and any document that flat out contradicts another document. For every hit, spin up a second agent to verify it against the source files and drop anything that does not hold up. Hand me one short discovery memo, ranked by how much each item changes the deal, with the exact files involved and the contradiction spelled out in plain English.

GUARDRAILS

- Works best on a folder with mixed file types, contracts, emails, spreadsheets
- Name the kinds of needles you care about so the agents know what to hunt
- The verify step is what keeps a juicy but wrong finding out of the memo

WHAT GOOD LOOKS LIKE

- A short discovery memo ranked by how much each item moves the deal
- Each item names the exact files and spells out the contradiction
- The buried side letter and the off-schedule lawsuit both surface

DEMO 2 — Proposal Factory

WHEN TO USE IT

- You send tailored proposals, SOWs, or onboarding docs
- You have a client list and one template you reuse
- You want personalized output, not mail-merge blanks

THE PROMPT

```
Build a workflow that reads clients.csv and generates one personalized proposal per row. For each client, draft a proposal using proposal_template.md as the structure, pulling scope and pricing from services_catalog.md and writing in the tone defined in brand_voice.md. Personalize every proposal to that client's industry, company size, pain point, and deal size. Then have an independent reviewer agent check each draft against the source data and the brand voice guide, and reject any proposal that invents facts, breaks the voice rules, or drifts off the client's actual pain point. Send rejects back for a rewrite. Save every approved proposal as its own markdown file in generated_proposals/, named after the company.
```

GUARDRAILS

- Have a clients.csv, a template, a brand voice file, and a services catalog in the folder
- The reviewer agent is what stops invented numbers and off-brand drift
- Point the output folder anywhere you like

WHAT GOOD LOOKS LIKE

- A folder of finished, on-brand proposals, one per client
- Every number traces back to that client's row in the CSV
- Drafts that drifted were caught and rewritten before saving

DEMO 3 — Compliance Sweep

WHEN TO USE IT

- A new standard or regulation just landed and you are in scope
- You have a pile of internal docs to check against it
- You need a prioritized fix-list, with false alarms removed

THE PROMPT

```
Audit every document in the company_documents folder against the new standard in standard.md. I want a workflow that runs one independent reviewer per document. Each reviewer reads its document and checks it clause by clause against every requirement in the standard, looking for gaps like retention periods that are too long, no breach notification window, missing right-to-deletion mechanism, undisclosed sub-processors, missing consent records, no accountable contact named, cross-border transfers with no safeguard, and blanket "any purpose" language. For every gap a reviewer finds, run a second independent agent that tries to refute it by rereading the document and any related document, and drop the gap if it cannot hold up. Then synthesize the surviving gaps into one prioritized remediation report that lists each failing document, the exact clause it violates, a severity, and the specific fix. Mark the documents that pass clean.
```

GUARDRAILS

- Put the standard in standard.md and the docs in company_documents/
- List the kinds of gaps you expect so the reviewers know what to hunt
- The refute step is what keeps false positives out of a compliance report

WHAT GOOD LOOKS LIKE

- One prioritized report sorted worst first
- Each row: the document, the clause it breaks, a severity, and the fix
- A clean list of the documents that passed, plus dropped false alarms

12 PROMPTS, 12 INDUSTRIES

The same move everywhere. Point it at a pile, let a team read it in parallel, make them check their own work. Swap the file and folder names for yours.

LAW

Read every contract in the data room and flag the deal-killers before the meeting.

Build a workflow that reads every contract in this folder, flags change of control, auto renewal, uncapped indemnity, and missing signatures, has a second agent challenge each flag, and returns one ranked risk memo.

FINANCE

Scan thousands of transactions and surface the handful that do not add up.

Build a workflow that reviews every transaction in this export, flags duplicates, outliers, and miscategorized entries, verifies each flag against the source rows, and returns a clean exceptions report.

HEALTHCARE

Check every patient chart against the latest care guidelines, in one pass.

Build a workflow that checks every chart in this folder against the guidelines in guidelines.md, flags gaps in documentation or follow up, verifies each gap, and returns a prioritized review list.

INSURANCE

Triage a mountain of claims and route only the ones that need a human.

Build a workflow that triages every claim in this folder, sorts them into auto approve and needs a human, explains each needs a human decision, and returns the queue ranked by urgency.

REAL ESTATE

Abstract an entire lease portfolio into one clean table overnight.

Build a workflow that abstracts every lease in this portfolio, pulls rent, term, renewal, and key dates into one table, verifies each extraction against the document, and flags anything unusual.

SOFTWARE

Find the one bug hiding across hundreds of files.

Build a workflow that audits every file under src for the missing auth check, has a second agent try to refute each finding, and returns only the confirmed issues with file and line.

MARKETING

Audit every competitor at once and find the openings.

Build a workflow that audits each competitor site in this list for messaging, offers, and SEO gaps, cross checks the findings, and returns one comparison sheet with the openings we can take.

RECRUITING

Screen a stack of resumes against the rubric, fairly and fast.

Build a workflow that scores every resume in this folder against the rubric in rubric.md, has a second agent check each score for bias and consistency, and returns a ranked shortlist with reasons.

COMPLIANCE

Check every document against the new rule and rank what to fix.

Build a workflow that checks every policy in this folder against the standard in standard.md, flags each gap, has a second agent refute false positives, and returns a ranked remediation list with the fix.

RESEARCH

Synthesize a pile of papers into one set of findings.

Build a workflow that reads every paper in this folder, pulls the key finding and method from each, cross checks the claims against each other, and returns one synthesis with the agreements and the conflicts.

SUPPORT

Turn thousands of tickets into the themes that actually matter.

Build a workflow that reads every ticket in this export, groups them into themes, counts each theme, surfaces the top drivers, and returns a summary with example tickets per theme.

GOVERNMENT

Read every public comment and surface the real concerns.

Build a workflow that reads every public comment in this folder, tags each by topic and sentiment, verifies the tags, and returns one summary of the main concerns ranked by how often they appear.

BUILD YOUR OWN

Every prompt in this pack is the same shape. Fill in the blanks and you have a workflow for anything.

```
Build a workflow that reads [every X in this folder] and [finds or does Y],  
looking for [the specific things you care about]. For every [hit], run a  
second independent agent that tries to [verify or refute] it against the  
source, and drop anything that does not hold up. Return [the exact output you  
want], ranked by [what matters most].
```

A worked example

Say you run a grants office and a hundred applications just came in.

```
Build a workflow that reads every application in this folder and scores each  
one against the criteria in rubric.md, looking for eligibility gaps, missing  
budget justification, and weak impact sections. For every low score, run a  
second independent agent that re-reads the application to confirm the gap is  
real and not just badly worded, and drop it if it does not hold up. Return  
one ranked shortlist with a one-line reason per application, and flag the  
borderline cases for a human.
```

WANT THE FULL SYSTEM?

Want to learn how to build workflows like these yourself, end to end? 🦊

Inside the **Early AI Dopters** community you get the full **LIVING** Claude Code system:

- The dynamic workflows patterns, fan-out, verify, save-and-reuse, taught from zero
- The ready-to-run demo folders from the video, including the 70-file data room
- Direct access to me and my team of coaches when you hit a wall
- A working group of operators shipping their own workflows every week
