

Lovable 2.0 Cheatsheet (2025)

A comprehensive guide to using Lovable 2.0, an AI-powered platform for creating full-stack web applications through natural language.

 **by Mark Kashef**

Tool Overview

Lovable 2.0 is an AI-powered platform that enables users of any skill level to create full-stack web applications by describing what they want in plain English. It combines coding, deployment, and collaboration tools in a single interface, allowing rapid development from idea to fully functional application.

Core Technology

AI Engine

Built on Anthropic's Claude Sonnet 3.7 model

Backend Integration

Native Supabase integration

Architecture

Combines open-source frameworks with modern front-end technologies

Collaboration

Real-time multiplayer editing with GitHub synchronization

Key Features at a Glance

Multiplayer collaboration

Workspace sharing for team development

Automated security

Vulnerability scanning to protect your applications

Intelligent chat mode

Agent for reasoning and planning

Dev mode

Direct code editing capabilities

Visual editing

UI design capabilities

Custom domain

Integration for professional web presence

Key Strengths

Accessibility

No coding experience required to build functional applications

Collaboration

Real-time multiplayer editing similar to Google Docs

Speed

Rapid prototyping and MVP development

Security

Built-in vulnerability scanning for Supabase projects

Flexibility

Both visual editing and direct code access

Domain Management

Integrated custom domain support

Limitations

Free Tier Restrictions

Strict message limits (5 messages per day)

Credit System

No rollover of unused credits

Customization Ceiling

Less suitable for highly complex, custom applications

Backend Options

Limited primarily to Supabase (no Firebase support)

Performance

Potential limitations for large-scale applications

Dependency

Reliance on AI-generated code may create technical debt

Communication & Interface Guide

Lovable 2.0 provides multiple ways to interact with the platform, each optimized for different tasks in the development process.

Chat Mode

The intelligent Chat Mode agent is 10x smarter than previous versions and supports:

- Multi-step reasoning
- File searching
- Log checking
- Database queries

The Chat Mode is the primary way to leverage the AI capabilities of Lovable 2.0, allowing you to describe what you want in natural language.

Chat Mode Best Practices

Be specific and detailed

Provide clear requirements in your prompts

Combine related requests

Group similar tasks into a single prompt to save credits

Use for planning

Explore options before committing to implementation

Debugging assistance

Identify and fix issues without modifying code directly

Example Chat Prompts

Authentication System

"Create a user authentication system with email verification and password reset functionality."

Database Optimization

"Analyze my database schema and suggest optimizations for better performance."

Bug Fixing

"Find the bug in my login form that's preventing form submission and suggest a fix."

Edit Mode

Edit Mode allows direct modification of your application:

Visual Editing

- Adjust styles visually through a graphical interface
- Modify properties like padding, margin, and alignment
- Preview changes in real-time

Code Editing

- Direct access to the codebase
- Modify AI-generated code
- Add custom functionality
- View and edit all project files

Edit Mode Best Practices

Preserve credits

Use Edit Mode without AI for small adjustments

Toggle between modes

Switch between visual and code editing based on the task

Use "Ask the AI to fix"

Leverage this button for error resolution (doesn't count toward credit limit)

Workflow Optimization

Efficient workflows in Lovable 2.0 can significantly improve development speed and quality while conserving credits.

Project Setup

Create a new project

- Navigate to dashboard
- Click "New Project"
- Choose a template or start from scratch
- Name your project

Define project requirements

- Use Chat Mode to describe your application
- Be specific about functionality, design, and data requirements
- Break complex applications into logical components

Set up collaboration (Paid plans)

- Create a workspace
- Invite team members (Pro: 2 collaborators, Teams: up to 20 users)
- Establish roles and permissions

Development Workflow

Initial generation

- Use Chat Mode to generate application structure
- Review generated code and make adjustments
- Test basic functionality

Iterative refinement

- Use specific prompts to enhance features
- Leverage visual editing for UI improvements
- Test frequently to ensure functionality

Debugging and optimization

- Use "Ask the AI to fix" for error resolution
- Run security scans before deployment
- Optimize performance based on AI recommendations

Deployment

- Connect custom domain (paid plans)
- Configure deployment settings
- Publish your application

Credit Conservation Strategies

Plan prompts carefully

Minimize the number of messages by planning ahead

Manual editing

Use Edit Mode without AI for minor changes

Use "Ask the AI to fix"

This feature doesn't count toward your credit limit

Combine requests

Group multiple requests into single, detailed prompts

Focus on high-impact tasks

Prioritize tasks that leverage AI capabilities

Performance Optimization

Optimizing your Lovable 2.0 applications ensures they run efficiently and provide a good user experience.

Application Speed Optimization

Minimize dependencies

Review and remove unnecessary packages

Image optimization

Use the platform's built-in image optimization

Code splitting

Request AI to implement code splitting for larger applications

Lazy loading

Implement for components not immediately needed

Database Optimization

Indexing

Ask AI to suggest appropriate database indexes

Query optimization

Have AI review and optimize complex queries

Connection pooling

Implement for high-traffic applications

Caching strategies

Request implementation of appropriate caching

Security Enhancements

Regular scanning

Run security scans before major updates

Authentication review

Ensure proper implementation of auth flows

Input validation

Verify all user inputs are properly validated

API security

Check for proper API key management and rate limiting

Resource Management

Credit usage monitoring

Track daily/monthly usage

Asset optimization

Compress images and minimize CSS/JS

Workspace organization

Structure projects logically within workspaces

Efficient prompting

Craft precise prompts to get desired results faster

Integration Capabilities

Lovable 2.0 offers robust integration options to extend your application's functionality.

Supabase Integration

Database setup

Automatically configured with proper schema

Authentication

Built-in user authentication flows

Storage

File storage and management

Edge Functions

Serverless function support

Realtime

Subscription-based realtime data

GitHub Integration & Custom Domains

GitHub Integration

- Repository sync: Connect to GitHub repositories
- Version control: Track changes and manage versions
- Collaboration: Coordinate with team members through GitHub
- CI/CD: Set up continuous integration/deployment

Custom Domain Integration

- Domain purchase: Buy domains directly within the platform
- DNS configuration: Automatic DNS setup
- SSL certificates: Automatic SSL provisioning
- Connection methods: Support for Entrip, Vercel, or Netlify

Third-Party Services

API integration

Connect to external APIs

Payment processing

Integrate payment gateways

Analytics

Add analytics tracking

Marketing tools

Email marketing, CRM integration

Project Type Optimization

Best For:

MVPs and Prototypes

- Rapid development of proof-of-concept applications
- Testing business ideas with minimal investment
- Iterating quickly based on user feedback

Content-Focused Websites

- Blogs and publishing platforms
- Portfolio websites
- Marketing landing pages
- Documentation sites

More Project Types

Internal Tools

- Admin dashboards
- Data visualization tools
- Workflow management applications
- Resource scheduling systems

E-commerce (Basic to Moderate)

- Product catalogs
- Simple shopping carts
- Basic payment processing
- Order management

Community Platforms

- Forums and discussion boards
- Member directories
- Event management
- Content sharing

Project-Specific Optimization Tips

For MVPs

- Focus on core functionality first
- Use built-in templates to accelerate development
- Implement basic analytics to track user behavior
- Prioritize features based on user feedback

For Content Sites

- Optimize image handling and storage
- Implement efficient content management flows
- Focus on responsive design for all devices
- Implement SEO best practices

For Internal Tools

- Prioritize user authentication and permissions
- Focus on data visualization capabilities
- Implement efficient database queries
- Create intuitive user interfaces

Troubleshooting Guide

Common issues you might encounter when using Lovable 2.0 and how to resolve them.

Quick Reference

Keyboard Shortcuts

- **Ctrl+S / Cmd+S**: Save changes
- **Ctrl+Z / Cmd+Z**: Undo
- **Ctrl+Shift+Z / Cmd+Shift+Z**: Redo
- **Ctrl+F / Cmd+F**: Find in file
- **Ctrl+/ / Cmd+/:** Toggle comment
- **Alt+Click**: Multiple cursors

Credit Usage

- 1 Chat Mode message = 1 Edit Mode message = 1 credit
- Edit Mode without asking AI to write code doesn't count toward limit
- "Ask the AI to fix" button messages don't count toward limit
- No accumulation of unused credits

Plan Comparison

Feature	Free	Pro (\$25/mo)	Teams (\$30/mo)
Daily Messages	5	Unlimited	Unlimited
Collaborators	0	2 per project	Up to 20
Custom Domains	No	Yes	Yes
Security Scanning	Limited	Full	Full
Workspaces	1	3	Unlimited
Projects	Limited	Unlimited	Unlimited
