

Give your AI a design it can follow.

Pick one screen and one user action. Put the decisions below in design-brief.md before asking the agent to build. Use the editable example in this download as a starting point.

01 / Choose the reference

Use one approved Figma frame or a screenshot you own. Name what should carry over: page structure, spacing, type or components. Include the mobile version and explain any deliberate differences.

02 / Write down the rules

Record exact colours, fonts, spacing, corner radius and content width. Name existing buttons, fields and cards to reuse. Add the real text and approved image files so the agent has less to invent.

03 / Describe the states

For the main action, show normal, hover, keyboard focus, loading, empty, success and error states where relevant. Say what happens after a click and which states are out of scope.

04 / Give the agent a finish line

List the screen, supported widths and one complete user journey. Define the evidence you expect: screenshots at those widths, working controls, keyboard checks and a list of unresolved issues.

Tool pairing for this workflow

Design reference: Figma, with its official MCP connection when your coding tool supports it. Build: your existing coding agent. Feedback: a real browser for visual and interaction checks; Playwright for repeatable checks. No Figma setup? Start with approved screenshots plus the same written brief.

Figma provides design context. Its connection depends on your client and account access. This kit recommends a workflow; it does not claim a benchmark or a tested integration.

Look. Click. Fix. Repeat.

Open the running app. Compare what it renders with the approved reference, then exercise the main action. A screenshot alone cannot prove a button works.

01 / Capture the actual screen

Start with 390px and 1440px widths, then use your product's real target sizes. Keep the route, test data and browser environment consistent. Capture the empty, loading, error and success states you specified.

02 / Test the interaction

Click the main button and verify the result. Tab through controls and confirm visible focus. Check labels, validation, hover states and overflow. Use test data and avoid real purchases or customer messages.

03 / Send a precise correction

Name the screen, width and state. Attach the screenshot, point to the mismatch and give the expected rule. Fix one issue at a time, then repeat the same check. Use `feedback-log.md` to record evidence.

04 / Keep an approved baseline

After a person approves the design, save reference screenshots. Playwright can compare later screenshots against them. Review differences before updating the baseline; an incorrect baseline preserves an incorrect screen.

Example correction

On the empty projects screen at 390px, the Create project button extends past the card. Keep the card at 16px side margins and the button inside it. Retest at 390px and 1440px, including keyboard focus. This is an illustrative example.

PASS BEFORE HANDOFF

Reference rules match • Main action works • Required states checked

Mobile has no horizontal overflow • Keyboard focus visible

Evidence attached • Remaining issues named
